Study information

Scientific Title

Prospective study of Molecular Adsorbents Recirculating System (MARS) therapy in chronic stable hepatic dysfunction

Study objectives

To test the hypothesis that Molecular Adsorbents Recirculating System (MARS) therapy could be used as a treatment for stable chronic alcoholic liver disease.

Ethics approval required

Old ethics approval format

Primary study design

Interventional

Study design

Randomised controlled trial

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Chronic alcoholic liver disease

Interventions

Patients with stable chronic alcoholic liver disease currently abstinent will be recruited from hepatology out-patient clinics. They will be randomised to a control non-treatment group or to MARS therapy. Those in the MARS group will be further randomised to group A or B. Those in group B will receive MARS every two weeks. The patients will be studied for 8 weeks. Vascular access would be by tunnelled cuffed right internal jugular dual lumen catheter inserted by a nephrologist under radiological screening. Hepatic encephalopathy, quality of life and symptom assessment will be sampled pre and post MARS treatments and in the non-MARS group at inclusion, 4 and 8 weeks. Portal pressure studies will be measured at the inclusion and the end of the study period. Systemic haemodynamics will be measured using a finometer.

Intervention Type

Procedure/Surgery

Primary outcome(s)

1. Quality of life and symptom load
2. Level of hepatic encephalopathy and biochemical parameters
3. Level of portal hypertension and systemic haemodynamics

Key secondary outcome(s)

Not provided at time of registration

Completion date

01/10/2007

Eligibility

Key inclusion criteria

Patients with stable alcoholic liver disease who are currently abstinent from alcohol.

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group
