Study information

Scientific Title

Improving the quality of information dermatologists receive from primary care: a multidisciplinary educational outreach

Study objectives

This study will investigate whether General Practitioners and Primary Care Nurses who take part in a multidisciplinary educational outreach intervention, designed to foster observational skills, display an increased accuracy of identification of diagnostic features in images of pigmented skin lesions. It will assess the feasibility of delivering such an intervention in primary care. Any improvement in observational skills would have direct implications for the quality of information received by dermatologists from primary care, with the potential to allow for improved prioritisation of out-patient appointments, and shorter waiting times for patients with potentially cancerous skin lesions.

Primary outcome(s)

This pilot project, based in primary care, addresses the national priority of Cancer Service Provision, and focuses on the importance of the flow of good information from primary care to secondary care, when referrals of suspicious skin lesions are made. Whilst this study focuses on one area of clinical practice - dermatology referrals from primary to secondary care, it is anticipated that any improvements in observational skills would have widespread implications for clinical practice. It is anticipated that the clinical area of concern of this work be broadened in further studies.

Key secondary outcome(s)
