Study information

Scientific Title

Study objectives
Using current World Health Organization (WHO) guidelines, children with wheezing are being over-prescribed antibiotics and bronchodilators are under utilised. To improve the WHO case management guidelines, more data is needed about the clinical outcome in children with wheezing/pneumonia overlap.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Ethics approval received fron:
1. Institutional Review Board (IRB) of Pakistan Institute of Medical Sciences, Islamabad, Pakistan
2. IRB of Queen Sirikit National Institute of Child Health, Bangkok, Thailand
3. World Health Organization (WHO) Ethical Review Committee

Primary study design
Interventional

Study design
Randomised controlled trial

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Wheeze and fast breathing

Interventions
1. Inhaled Salbutamol and reassessment after up to three cycles of bronchodilator therapy repeated at 15 minute interval if necessary
2. Metered Dose Inhaler (MDI) with spacer device

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Proportions of children aged 1 - 59 months with auscultatory wheeze and fast breathing or lower chest indrawing:
1. Respond to up to three cycles of inhaled salbutamol: response defined as no fast breathing or lower chest indrawing present
2. Fail therapy at day 3 or days 5 - 7 of the initial successful bronchodilator therapy with inhaled salbutamol? Therapy failure defined as:
2.1. Relapse: develop fast breathing or chest indrawing afresh, that does not respond to three cycles of inhaled salbutamol

2.2. Development of any danger sign (except wheezing and fever in young infant)
2.3. Death
2.4. Severe adverse reaction to salbutamol

Key secondary outcome(s)
In children aged 1 - 59 months with auscultatory wheeze and fast breathing or lower chest indrawing:
1. Proportion with audible wheeze at initial assessment
2. Proportion of responders to up to three cycles of inhaled salbutamol associated with:
2.1. Age
2.2. Respiratory Syncytial Virus (RSV) isolation
2.3. Season
2.4. Number of previous wheezing episodes
2.5. Audible versus auscultatory wheeze
2.6. Family history of asthma
3. Proportion of relapses in children who showed initial improvement associated with:
3.1. Age
3.2. RSV isolation
3.3. Season
3.4. Number of previous wheezing episodes
3.5. Audible versus auscultatory wheeze
3.6. Family history of asthma
4. Received any antibiotic for this or any concurrent illness before follow-up
5. Loss to follow-up
6. Withdrawal of consent

Completion date
01/04/2002

Eligibility

Key inclusion criteria
1. Age 1 to 59 months
2. Audible/auscultatory wheeze
3. Respiratory rate above age specific cut off point or lower chest indrawing
4. Classified as no pneumonia with wheeze

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Child

Lower age limit
1 Months

Upper age limit

59 Months

Sex
All

Key exclusion criteria
1. Presence of danger sign:
1.1. Up to two months: stopped feeding well, drowsy, convulsions, stridor in a calm child, fever
1.2. 2 - 59 months: convulsions, clinically severe malnutrition, unable to drink
2. Antibiotics during last 48 hours

Date of first enrolment
01/05/2001

Date of final enrolment
01/04/2002
