Study information

Scientific Title

Randomised controlled trial of Tumour necrosis factor inhibitors Against Combination Intensive Therapy with conventional disease modifying anti-rheumatic drugs in established rheumatoid arthritis

Acronym

TACIT

Study objectives

Active Rheumatoid Arthritis (RA) patients, who meet the National Institute for Clinical Excellence (NICE) criteria for treatment with Tumour Necrosis Factor (TNF) inhibitors, will gain equivalent benefit from intensive combination therapy (two or more Disease Modifying Anti-Rheumatic Drugs [DMARDs] and steroids) at substantially less expense and without increased toxicity.

More details can be found at: <http://www.nets.nihr.ac.uk/projects/hta/0630384>

Protocol can be found at: http://www.nets.nihr.ac.uk/__data/assets/pdf_file/0003/51339/PRO-06-303-84.pdf

Ethics approval required

Old ethics approval format

Ethics approval(s)

Research ethics committee of the UCLH A, 20/04/2007, ref: 07/Q0505/57

Study design

Two-arm pragmatic 12-month randomised controlled multi-centred trial using open-label treatments

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Rheumatoid arthritis

Interventions

There will be two treatment algorithms:

1. For TNF inhibitors, and
2. For combination DMARDs

Treatments will be individualised and will depend on patients' responses.

TNF inhibitors:

All three licensed agents - adalimumab, etanercept, and infliximab - will be allowed at standard doses (British National Formulary). The choice of TNF inhibitor will reflect patient's preferences and local circumstances. Methotrexate will also be given to maximise efficacy and (in the case of infliximab) reduce anti-chimeric antibodies. Any patient intolerant to methotrexate may take another DMARD.

Combination DMARDs:

DMARDs from the following list will be used: methotrexate, sulfasalazine, hydroxychloroquine, leflunomide, ciclosporin and gold injections (sodium aurothiomalate) in combinations with proven efficacy over DMARD monotherapy in Randomised Controlled trials (RCTs). For example:

1. Triple therapy with methotrexate (methotrexate-sulfasalazine-hydroxychloroquine)
2. Other methotrexate combinations (methotrexate-ciclosporin, methotrexate-leflunomide and methotrexate-gold)
3. One sulfasalazine combination (sulfasalazine-leflunomide)

Additional monthly steroids (intramuscular [IM] depomedrone [120 mg stat] or equivalent) will also be used if needed.

The duration of treatment is one year and patients are followed for only this year.

Intervention Type

Drug

Phase

Phase IV

Drug/device/biological/vaccine name(s)

Adalimumab, etanercept, infliximab, methotrexate, sulfasalazine, hydroxychloroquine, leflunomide, ciclosporin and gold injections (sodium aurothiomalate)

Primary outcome(s)

Heath Assessment Questionnaire (HAQ).

Primary and secondary outcomes will be measured at baseline (month 0), 6 months and 12 months.

Key secondary outcome(s)

1. Joint damage
2. Quality of life
3. Disease activity
4. Withdrawal rates
5. Adverse effects
6. Economic evaluation:
 - 6.1. Societal costs
 - 6.2. Cost-effectiveness
 - 6.3. Cost-utility

Primary and secondary outcomes will be measured at baseline (month 0), 6 months and 12 months. Patients will be asked to attend monthly for blood monitoring and will be asked a short questionnaire regarding concomitant medication, any tests outside routine monitoring and adverse events within the last month.

Completion date

31/03/2010

Eligibility

Key inclusion criteria

1. Males and females aged over 18 years
2. Established RA by the criteria of the American College of Rheumatology
3. Disease duration of at least 12 months
4. Meet NICE criteria for being prescribed TNF inhibitors:
 - 4.1. Disease Activity Score (DAS) over 5.1
 - 4.2. Failure to respond to two DMARDs including methotrexate
 - 4.3. No contra-indications to TNF inhibitors (including possibility of pregnancy)

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

1. Unable or unwilling to give informed consent
2. Failure of, or contra-indications to, all proposed DMARD combinations (including possibility of pregnancy)
3. Serious inter-current illness
4. Patients on high dose steroids (in excess of 10 mg prednisolone or equivalent per day at trial entry)
