Plain English summary of protocol

Background and study aims
A bioresorbable scaffold (BRS) can hypothetically decrease the risk of an adverse cardiac event in the long-term perspective. The BRS is a device which is inserted into a blood vessel in order to expand the vessel to prevent or alleviate a blockage, manufactured from a material that may dissolve or be absorbed in the body. The of the study is to assess the long-term outcomes of using a BRS for the urgent treatment of coronary artery block.

Who can participate?
Patients undergoing surgery for STEMI type heart attack.

What does the study involve?
Patients undergoing urgent surgery for a STEMI type heart attack will be treated using the BRS and followed up over 5-years during their regular appointments.

What are the possible benefits and risks of participating?
An improved long-term outcome with normal vessel anatomy (no vessel metallic cage as the device is resorbed over time).
Higher risk of scaffold late thrombosis.

Where is the study run from?
1. University Hospital Kralovske Vinohrady third medical faculty, Charles University, Czechia
2. Military hospital Prague, Czechia

When is the study starting and how long is it expected to run for?
December 2012 to December 2020

Who is funding the study?
Univerzita Karlova v Praze (Charles University, Prague), Czechia

Who is the main contact?
Dr Petr Tousek,
petr.tousek@fnkv.cz

Additional identifiers

Study information

Scientific Title
Bioresorbable scaffold implantation in STEMI patients

Acronym
PRAGUE-19

Study objectives
Good longterm clinical outcome after bioresorbable scaffold (BRS) implantation, complete scaffold resorbtion at 5 year with stable lumen patency

Ethics approval required
Old ethics approval format

Ethics approval(s)
1. Approved 09/01/2013, Local and multicenter ethical committee of the University Hospital Kralovske Vinohrady (Srobatrova 50, Prague 10, eticka.komise@fnkv.cz, +420267162272), ref: EK-VP/02/2013
2. Amendment approved 03/10/2018, ref: EK-VP/02/4/2013

Study design

Prospective two-centre open-label registry study

Primary study design
Observational

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Acute myocardial infarction with ST segment elevation

Interventions
Use of bioresorbable scaffold (AbsorbTM BRS) during primary coronary intervention.
Patients enrolled in this study were treated during primary percutaneous coronary intervention (PCI) with the bioresorbable scaffold implantation (in some of the patients, optical coherence tomography (OCT) was performed just after BRS was implanted - if clinically possible).
Patients are followed by clinical and phone controls during 5 years.
First 25 eligible patients that agreed with the contol invasive imaging underwent 5 year coronary angiography and OCT.

Intervention Type
Device

Phase
Phase IV

Primary outcome(s)
At 5 years:
1. Death using patient records
2. MI using patient records
3. Target vessel revascularization as recorded in records by a specialist

Key secondary outcome(s))
Vessel invasive assessment using QCA and optical coherence tomography at baseline and 5 years.

Completion date
15/12/2020

Eligibility

Key inclusion criteria
1. STEMI patients
2. Sign informed consent

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
All

Total final enrolment
117

Key exclusion criteria
1. Severe calcification
2. Do not meet specified vessel size
3. Length of the lesion more than 28mm
4. Indication for anticoagulation, cardiogenic shock

Date of first enrolment
15/12/2012

Date of final enrolment
15/12/2015
