Study information

Scientific Title

Study objectives
A two-armed randomised controlled trial of the effectiveness of a 6 week intervention designed to reduce informal carer distress. Specifically, we aimed to evaluate the effects of an intervention for distressed informal carers of patients receiving specialist palliative care on:
1. Carer well-being (primary outcome)
2. Carer strain
3. Carer quality of life
4. Carer bereavement outcome
5. The proportion of patients dying at home

Ethics approval required
Old ethics approval format

Ethics approval(s)
Not provided at time of registration

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Quality of life

Health condition(s) or problem(s) studied
Informal carers of patients receiving specialist palliative care

Interventions
Six weekly visits from a carer advisor versus usual care

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Change in carer distress as measured by General Health Questionnaire 28 (Goldberg & Williams 1988) 4, 9 and 12 weeks after randomisation.

Key secondary outcome(s))
1. Caregiver Strain Index: 4, 9 and 12 weeks after randomisation
2. Care-Giver Quality of Life Index (Cancer): 4, 9 and 12 weeks after randomisation
3. Carer Bereavement: 4 months after the patients death

Completion date

31/10/2003

Eligibility

Key inclusion criteria
1. Informal carers of patients receiving specialist palliative care
2. Able to give informed consent
3. No organic brain disease
4. over 18 years.

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 years

Sex
All

Key exclusion criteria
1. Unable to understand English
2. Unable to give informed consent
3. Organic brain disease or dementia
4. Under 18 years of age.

Date of first enrolment
01/10/2000

Date of final enrolment
31/10/2003
