Study information

Scientific Title
A placebo-controlled double blind preliminary trial to study the efficacy and safety of Gelclair in controlling the symptoms of oral lichen planus

Study objectives
To compare the symptom control offered by Gelclair vs placebo in patients with symptomatic oral lichen planus. Gelclair will be a useful adjunct in the management of pain associated with oral lichen planus.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Not provided at time of registration

Primary study design
Interventional

Study design
Randomised controlled trial

Study type(s)
Not Specified

Health condition(s) or problem(s) studied
Skin and Connective Tissue Diseases: Oral lichen planus

Interventions
Patients presenting to the department of oral medicine will be assessed for their suitability for inclusion within the trial. They will be invited to take part if they are diagnosed with lichen planus not due to a specific cause and confirmed histologically. They will be paired according to their symptoms at the time of presentation and randomised to either Gelclair or placebo. Normal treatment for lichen planus in the form of topical steroids will be prescribed as normal.

Intervention Type
Drug

Phase
Not Specified

Drug/device/biological/vaccine name(s)
Gelclair

Primary outcome(s)
Gelclair is of use in managing the symptoms of pain in oral lichen planus. Primary response criteria: symptom control over an eight-week period, usage of topical corticosteroids (patient-controlled).

Key secondary outcome(s)
Tolerability and acceptability

Completion date
15/06/2005

Eligibility

Key inclusion criteria
30 patients in control (placebo) group, 30 in Gelclair. Matched by symptoms and extent of disease at initial presentation.

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Not Specified

Sex
Not Specified

Key exclusion criteria
