Study information

Scientific Title
Sevoflurane inhalational introduction in the elderly: a comparison with intravenous induction

Study objectives
The aim of the study is to compare the effects of an inhalational induction of anaesthesia with sevoflurane with an intravenous induction in elderly patients. In particular, we will assess the

effects on cardiovascular parameters (heart rate, blood pressure), and cerebral blood flow velocity. We hypothesise that compared with an intravenous induction an inhalational induction will be more stable.

Primary study design
Interventional

Study design
Randomised controlled trial

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Anaesthesia

Interventions
Randomised controlled trial:
1. Inhalational induction of anaesthesia with sevoflurane
2. Intravenous induction of anaesthesia with sevoflurane

Intervention Type
Drug

Phase
Not Applicable

Drug/device/biological/vaccine name(s)
Sevoflurane

Primary outcome(s)
Change in blood pressure and cerebral flow velocity during induction of anaesthesia compared to baseline values.

Key secondary outcome(s)
Not provided at time of registration

Completion date
14/11/2002

Eligibility

Key inclusion criteria
Total number of subjects = 40

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Senior

Sex
All

Key exclusion criteria
