Study information

Scientific Title

Study objectives

We tested, in a randomised, double-blind, placebo-controlled trial, the effects of pregabalin on pain relief, tolerability, health status, and quality of life in patients with central neuropathic pain.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Ethics approval received from the local medical ethics committee

Study design

Randomised, triple blind, placebo controlled, parallel group trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Central neuropathic pain

Interventions

Pregabalin versus placebo.

Intervention Type

Drug

Phase

Not Specified

Drug/device/biological/vaccine name(s)

Pregabalin

Primary outcome(s)

The primary efficacy parameter is a pain intensity score recorded by patients (at baseline, and four weeks following treatment), using a Visual Analog Scale (VAS).

Key secondary outcome(s)

Health status and Quality of Life (QOL) questionnaires (secondary outcomes) were completed before start of treatment and four weeks following start of treatment.

Health status and QOL measurements included the Pain Disability Index (PDI), the EuroQoL questionnaire (EQ-5D), and the Medical Outcomes Short-Form Health Survey questionnaire 36 (SF 36).

Completion date

30/12/2006

Eligibility

Key inclusion criteria

1. Age 18 years or older
2. Written informed consent
3. Patients suffering from severe neuropathic pain caused by lesion or dysfunction in the central nervous system. Neuropathic pain was described by at least one of the following:
 - a. burning pain
 - b. paroxysmal episodes of shooting pain
 - c. pain on light touch

Additionally, patients had to score above 12 on the Leeds Assessment of Neuropathic Symptoms and Signs questionnaire (LANSS)

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

Not Specified

Key exclusion criteria

1. Pregnant
2. Had a history of intolerance, hypersensitivity, or known allergy to pregabalin
3. Had a known history of significant hepatic, renal, or psychiatric disorder
4. Had a history of galactose-intolerance, lactase deficiency, or glucose-galactose malabsorption syndrome
5. Subjects with a calculated creatinine clearance rate below 60 mL/m (estimated from serum creatinine using Cockcroft-Gault equation) were specifically excluded
6. No new analgesic therapies were to be initiated at any time during the trial
7. Patients who had been exposed previously to gabapentin, regardless of dose and treatment duration, were permitted to enter the study. However, treatment with gabapentin was to be discontinued at least three days before receiving study medication
