Study information

Scientific Title

Study objectives
It is hypothesised that a pain consult at the specialized pain clinic in combination with Patient Education Program is more effective in reducing average pain intensity compared to a pain consult alone. A pain consult at the specialized pain clinic is more effective in reducing average pain intensity compared to standard care.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Ethics approval received from the local medical ethics committee

Primary study design
Interventional

Study design
Randomised controlled trial

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Cancer pain

Interventions
1. Standard care
2. Second opinion pain consult at the specialist pain clinic
3. Second opinion pain consult combined with Pain Education Program and monitoring by nurse specialists

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Average pain reduction measured by numeric rating scale during the study period.

Key secondary outcome(s)
Effect of the interventions after 2, 4 and 8 weeks on:
1. Adherence to ATC analgesics
2. Worst pain reduction
3. Average pain reduction
4. Present pain reduction
5. Proportion of patients with clinically relevant pain reduction
6. Pain interference
7. Quality of life
8. Reduction of side effects

9. Adequacy of pain treatment
10. Pain knowledge

Completion date
31/12/2007

Eligibility

Key inclusion criteria
1. Cancer-related pain or cancer treatment related pain for at least two weeks
2. Nociceptive pain
3. Average pain intensity score of 4 or more
4. Accessibility by telephone
5. A life expectancy of at least three months
6. Informed consent

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
All

Key exclusion criteria
1. Neuropathic pain
2. Residing in nursing home or retirement home
3. Pain not treated with oral medication
4. Radiotherapy in the past two weeks

Date of first enrolment
01/02/2006

Date of final enrolment
31/12/2007
