Study information

Scientific Title

A prospective, open, randomized, multicenter study comparing the effects of everolimus versus mycophenolate sodium as compared to ciclosporin as maintenance therapy in renal allograft recipients, on chronic allograft damage and cardiovascular parameters.

Acronym
MECANO

Study objectives
By achieving optimal immunosuppression with minimal side-effects due to controlled drug exposure by target AUCs, we expect reduction of drug-induced damage on kidney and cardiovascular system. Three drugs will be the subject of the study: cyclosporine, mycophenolate and everolimus.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Received from local medical ethics committee

Primary study design
Interventional

Study design
Multicentre, randomised, parallel group trial

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Renal transplant

Interventions
By achieving stable state 6 months after renal transplantation, a baseline renal allograft biopsy is performed and randomisation to one of the three arms of the study takes place.
Arm 1: prednisolone and AUC guided cyclosporine treatment
Arm 2 : prednisolone and AUC guided mycophenolate mofetil sodium treatment
Arm 3: prednisolone and AUC guided everolimus
All treatment arms have a duration of 18 months where after a final renal allograft biopsy is performed.
It has to be noted that for the 3 treatment arms no separate control group is defined because no data exists addressing the 'golden standard' treatment after renal transplantation.

Intervention Type
Drug

Phase
Not Specified

Drug/device/biological/vaccine name(s)
mycophenolate sodium, everolimus, cyclosporine

Primary outcome(s)
Degree of inflammation and fibrosis and degree of arteriolar hyalinosis in renal biopsies taken at 6 and 24 months after implantation.

Key secondary outcome(s)
1. Vascular assessments by IMT and M-mode of carotis interna
2. Blood pressure and number of antihypertensive drugs
3. Lipid profile
4. Renal allograft survival and function
5. Patient survival
6. Incidence of malignancies
7. Infectious complications

Completion date
01/01/2008

Eligibility

Key inclusion criteria
1. First or second renal transplant
2. Female or male 18-70 years old
3. Cadaveric or non-HLA identical living donor
4. Understands risks and purpose of study
5. Written informed consent

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 Years

Upper age limit
70 Years

Sex
All

Key exclusion criteria
1. Double kidney transplants, kidney-pancreas transplants, 3rd or 4th transplant
2. PRA >50% historic or current
3. Pregnancy or unwilling to use contraception during the study
4. Cholesterol >8.5 mmol/l
5. History of therapy resistance against HMG co-reductase inhibitors

Date of first enrolment
01/01/2004

Date of final enrolment
01/01/2008
