Study information

Scientific Title

Radiofrequency ablation of Barrett's columnar lined oesophagus and squamous dysplasia: multicentre trial with long term follow up using a central database

Study objectives

The aim of this prospective, multi-centre patient registry study is to provide a tool for participating physician investigators to collect outcome data related to the use of the HALO Ablation Systems. We hypothesise that RFA is safe and effective in treating patients with dysplasia arising in Barrett's oesophagus and will maintain a durable response.

Ethics approval required

Old ethics approval format

Ethics approval(s)

National Research Ethics Service (NRES), ref: 08/H0714/27

Primary study design

Observational

Study design

Prospective multi-centre patient registry

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Oesophageal Cancer/ Barrett's Oesophagus

Interventions

HALO radiofrequency ablation (HALO RFA)

The study collects the outcomes of patients undergoing the intervention which is RFA. The study collects not just demographic data on patients eligible for RFA treatment but also the effectiveness of the treatment in curing them of early oesophageal neoplasia. The study collates the number of procedures required to get to this point but also examines the reasons why we fail in a minority of patients so we can try understand these patients to help improve our practice and streamline our approach to them.

Intervention Type

Procedure/Surgery

Primary outcome(s)

1. Endoscopic clearance rate for Barrett's esophagus. Percentage of patients with no endoscopically visible Barrett's oesophagus at 1 year follow-up
2. Histological clearance rate for intestinal metaplasia. Percentage of patients with no histological evidence of intestinal metaplasia at 1 year follow-up
3. Histological clearance rate for columnar dysplasia. Percentage of patients with baseline dysplasia who have no histological evidence of dysplasia at 1 year follow-up
4. Sub-squamous intestinal metaplasia. Percentage of patients at 1 year follow-up with sub-squamous intestinal metaplasia, with or without dysplasia, that is covered completely by an intact layer of squamous epithelium with no communication with the surface

Key secondary outcome(s)

Ability of aneuploidy and other molecular changes to predict success or failure of this therapy.

Completion date

31/03/2028

Eligibility

Key inclusion criteria

1. Patients will be recruited from those referred for ablative management of Barrett's oesophagus or squamous dysplasia with HALO RFA
2. Patients must have no contraindications to endoscopy
3. Males and non-pregnant females over the age of 21 years. Female patients who are pre-menopausal must practice a medically acceptable form of contraception.
4. Patients must sign an informed consent form

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

21 Years

Sex

All

Key exclusion criteria

1. Presence of invasive carcinoma of the oesophagus
2. Patients in whom endoscopy is contraindicated
3. Patients with oesophageal varices
4. Previous radiotherapy
5. Patients who have undergone Hellers myotomy
6. Pregnant females
7. People under the age of 21 years

Date of first enrolment

31/03/2008

Date of final enrolment

30/09/2027
