Plain English summary of protocol

Background and study aims
Healing abutments (also called healing cuffs or caps) help the gum tissue around dental implants to heal. Frequent changes of healing abutments have been associated with negative effects on wound healing around the implant. The aim of this study is to compare the levels of markers of inflammation and tissue destruction around implants with customized and standard healing abutments.

Who can participate?
Patients with partial posterior edentulism, aged over 18 years, adequate bone quality and availabilty for implant placement, no signs of inflammation in the region where implant placement is planned, good systemic health conditions and stable occlusion

What does the study involve?
Implants are randomly allocated into one of two groups. One group of implants will be fitted with a one-piece titanium customized abutment after implant insertion. Control group implants will be fitted with standard healing abutments. Mouth fluid collection and x-rays will be carried out at suture removal at 1 week after implant placement, following crown delivery after 3 months, and at 6 months follow-up. Intraoral scanning will be performed to compare the changes in the soft tissue around the implant.

What are the possible benefits and risks of participating?
There are no risks expected for participants.

Where is the study run from?
Medical University of Vienna (Austria)

When is the study starting and how long is it expected to run for?
August 2017 to June 2022

Who is funding the study?
MIS Implants Technologies Ltd (UK)

Who is the main contact?
Dr Christian Wehner
christian.wehner@meduniwien.ac.at

Study information

Scientific Title
Effects of customized CAD/CAM abutments on cytokine levels in peri-implant crevicular fluid during early implant healing: a pilot study

Study objectives
It is hypothesized that the use of customized healing abutments for dental implants induces an altered inflammatory response compared to standard healing abutments.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Approved 05/09/2017, Ethics Committee of the Medical University of Vienna (Borschkegasse 8b /6, 1090 Vienna, Austria; +43(0)1 404 00 21470; ethik-kom@meduniwien.ac.at), ref: 1807/2017

Study design
Interventional single-centre randomized controlled trial

Primary study design
Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied
Need for dental implant placement to replace missing tooth/teeth

Interventions
The aim of this exploratory randomized, controlled clinical trial is to assess the effect of one-piece individualized titanium abutments on biomarkers associated with inflammation and tissue degradation in peri-implant crevicular fluid (PICF) as well as marginal bone levels during the early healing phase.

The researchers plan to place a total of 30 dental implants in patients with partial posterior edentulism. Implant sites are randomized using online available tools (https://www.randomizer.org/) to either receive individual or standard healing abutments. 15 implants will receive a one-piece titanium abutment that will be fabricated using computer-aided design/computer-aided manufacturing (CAD/CAM) subsequently after implant insertion. Control group implants (n=15) will be provided with standard healing abutments. Peri-implant sulcus fluid collection, standardized periapical radiographs applying parallel technique and intraoral scanning will be carried out at suture removal 1 week after implant placement (T1), following crown delivery after 3 months (T2), and at 6 months follow-up (T3).

Intervention Type
Procedure/Surgery

Primary outcome(s)
Peri-implant inflammation and tissue destruction measured by levels of biomarkers (pg/ml) in peri-implant crevicular fluid (PICF) at suture removal, at crown delivery and at 6 months follow-up

Key secondary outcome(s))
Marginal bone loss (mm) measured radiographically at suture removal, at crown delivery and at 6 months follow-up

Completion date
01/06/2022

Eligibility

Key inclusion criteria
1. Aged >18 years old
2. One or more missing teeth in the molar region of the upper and/or lower jaw
3. Adequate bone quality and availability for implant placement
4. No signs of inflammation in the region where implant placement is planned
5. Good systemic health conditions
6. Stable occlusion
7. Willing to participate and attend follow-up appointments

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 years

Sex
All

Total final enrolment
22

Key exclusion criteria
1. Presence of untreated periodontitis
2. Smokers (>10 cigarettes per day)
3. Alcoholism or drug abuse, history of chemotherapy or radiation
4. Diabetes with >7.5 HbA1c

Date of first enrolment
01/01/2019

Date of final enrolment
01/01/2022
